

Cataract Surgery Eye Drop Options/Instructions

We offer two post-operative medication options for your cataract surgery. We understand drops are both burdensome to use and can become costly, therefore our goal is to provide you with the most cost-effective option tailored for you.

Option 1: Less Drops / Compounded eye drops from ImprimisRx Pharmacy

Pred-Moxi-Brom (Steroidal, Antibiotic & Non-steroidal Anti-Inflammatory)- Purchased from Medical Center Eye Clinic. **Start 1 day** prior to surgery. Use 1 drop in surgical eye 4 times per day for **1 week after surgery**.

Pred-Brom (steroid and non-steroidal anti-inflammatory)- Purchase from Medical Center Eye Clinic. **Tapered schedule starting on post-operative day 8:** Use 1 drop two times per day for 2 weeks then once per day for 3 weeks.

***The cost for this option is \$70 for Pred-Moxi-Brom & \$60 for Pred-Brom payable to the clinic. May have to purchase a second bottle of Pred-Brom for 2nd eye.**

Option 2: Traditional drops picked up from the pharmacy.

All drops are started 1 day before surgery!

Ofloxacin (antibiotic) - Use 1 drop in surgical eye four times per day for 7 days after surgery.

Prolensa (Non-Steroidal Anti-Inflammatory) - Use 1 drop in surgical eye 1 time a day for 4-6 weeks.

Lotemax SM (Steroidal Anti-Inflammatory) – Tapered schedule: Use 1 drop in surgical eye three times per day for 1 week, then two times per day for 2 weeks, then one time per day for 3 weeks.

***The cost will vary based on insurance coverage. Many of our patients have reported these drops cost in excess of \$400 without coupons. Coupons are an option to bring down the cost but still can be costly since they are branded medications.**
